WPI; 1998-333253/29.

Antisense oligonucleotides to ICAM-1, E-selectin or VCAM-1 - useful for treating diseases having an inflammatory component, e.g. psoriasis, wounds and septic shock.

Claim 8; Page 40; 48pp; English.

The sequence is that of an antisense oligonucleotide which is substantially complementary to at least a portion of the pre- or mature start transcript of human intracellular adhesion molecule (ICAM), Eselectin or vascular cell adhesion molecule (VCAM). It can be used to inhibit expression of these proteins. Inhibition of these proteins forms the basis for treatment of conditions and diseases that have an inflammatory component, e.g. acne, postiacis, arthitis, organ rejection, wounds, burns, septic shock or inflammatory complications of septic shock

Hall J; Guida M, WPI; 2002-698522/75.

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 16; Page 130; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid

molecule comprising at least one base variation from that of a known

CC molecule comprising at least one base variation from that of a known

CC human cytochrome P450 Al (CYP4501A1), adrenergic receptor betal (ADBR1),

cytochrome P450 O2E1 (CYP4501A21), adrenergic receptor betal (ADBR1),

CC (ANNY), cathepsin S (CTSS), cytocoxgenase 2 (CXS), diazepam binding

CC (ANNY), cathepsin S (CTSS), cytocoxgenase 2 (CXS), diazepam binding

CC (ANNY), putathione-S-transferase 12 (GST12), histamine-N-methyl

CC transferase (HNMY), NADPH quinone oxidoreductase 2 (NGO2),

CC (ADBL), putathione-S-transferase 2B7 (UGT2B7), instamine-N-methyl

CC (MRD1), adventione (NRD12B7), untiding resistance associated procein 3

CC (MRD1), actotransferrin (LTF), multidrug resistance associated procein 3

CC (MRD1), orpha nuclear receptor (NRD12B7), untiding resistance

CC (MRD1), orpha nuclear receptor (NRD12B7), untiding resistance

CC (MRD1), orpha nuclear receptor (NRD12B7), chantion receptor (NRD1COT)

CC (MRD1), orpha nuclear receptor (NRD1COT)

CC (MRD1), or realing the dasorders responsible for a variety of disorder-related

CC craits as a result of their e.g., overexpression, constitutive

CC and/Or rreating the disorders. The nucleic acid molecules comprising the

CC ARNI, EPHX2, GST12, NNWT, NQO2, NR112, STM, UGT2B4, UGT2B7, UGT2B15, ARNI, EPHX2, GST12, NNWT, NQO2, NR112, STM, UGT2B4, UGT2B7, CYPP4501A2,

CR ARNI, EPHX2, GST12, NNWT, NQO2, NR112, STM, UGT2B4, UGT2B7, UGT2BB1, UGT2BB1

CC Secptibility to concern polymorphic sequences in ADRAB1 or CHMR2 are

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine Mbol DNA fragments of between 250 and 500
by with an (AC1)5 and a (TC)15 oligomiclecide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100,000. The sequence information
of cr ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
specification and indexed herein (see below). The sequences upstream and
commerced CR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
connecting See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
                                Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to Simple Sequence Repeats (SSRs) from

                                                                                                                                                                                                            ö
clover species. SSRs, also called microsatellites, are based on a 1-7 nuclectide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs may be purity of legume seed barches. The present sequence is and for testing the abuse used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the 5' anchored (ISSR)-PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  repeat; ISSR; SSR; PCR; primer; genotyping; plant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes, useful for genotyping diverse genomes of plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequences AAH17205 - AAH40944 represent PCR primers, single nucleotide polymorphisms SNPs. The present invention sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP filmling as uncleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for generation reaction. The oligonucleotide are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid sample by consense by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial cates of which a component is or may be genetic such as autoimmune chisaase including, rheumatoid arthritis, multiple sclerosis, incloring and containing DNA sequence represents a PCR primer specific cor a human SNP containing DNA sequence
                                                                                                                                                                                                    Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumaroid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DB 1; Length 24;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Seguence 24 BP; 1 A; 0 C; 11 G; 12 T; 0 U; 0 Other;

The protein is useful for treating various diseases, such as malignant tumours, haemopathy, HIV infection, immunological diseases and various inflammations. The present sequence is a PCR primer, which was used in an example from the invention
                                                                             Murine, tricarboxylic acid carrier 13.53; tumour, cytostatic; haemopathy;

                                                                                                                                                                        Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor segment. The present sequence complementary to an adaptor segment. The prepresents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for genetic trait marking and germplasm comparisons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial
Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mole. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

mcgarry191-19.rng

animal or plant breeding or pedigree analysis. The sequences AAT66084-T66107 represent repeat sequences of low informativeness found in specific human genes. This repeat sequence is found in the haemoglobin gamma G gene located at chromosomal position 11p15.5. The sequence is amplified by primers AAT66094-5. (Updated on 25-MAR-2003 to correct PF 888888888

Obtaining unknown DNA sequence flanking a single known sequence for use as PCR templates, involves single site amplification with polymerase having strand displacement capability.

Example 1; Col 9-10; 11pp; English.

This invention describes a novel method for obtaining DNA of unknown sequence flanking a single site of known sequence involves single site amplification of circular DNA template flanking a target DNA of known sequence using a polymerase having strand displacement capability. The method is used for obtaining a particular target DNA sequence that can be useful as templates that contain entire simple sequence repeat (SSR) alleles for amplification (SSA) procedures e.g. PCR or can be employed as molecular markers, e.g. in distinguishing between species, strains or varieties within species or identifying the presence of a disease condition. It also provides a marker for use in areas such as import and export regulation, variety and ecotype identification, marker sequences to see to generate a linear DNA molecule containing two target sequences used to generate a linear DNA molecule containing two target sequences. It can also be used for e.g. for cloning cDNA or genomic DNA which flanks any known short target sequence. The present method can also be used to obtain entire coding regions of genes based upon a known nucleic acid sequence or by using a degenerate nucleic acid sequence or by using a degenerate nucleic acid sequence back translation RESULT 144
AAZ89471/C

ö using a polymerase having strand displacement capability which can synthesize up to 10 kb fragments. This is especially useful for obtaining plant genes which are usually less than 10 kb in length. The method allows accelerated development of high resolution DNA markers that may be used for fingerprinting, mapping etc., using small amounts of tissue (less than 1 mmg). It also allows the production of a PCR template with knowledge of only one region of target equence, the size of which is regulated only by the primer design. The present method also eliminates genomic DNA library preparation and screening which are the most time consuming steps, typically requiring no less than three months, with total time for target DNA development being between 4-6 months. Composition for modulating transcription or replication of a pre-selected target sequence and for treating a plant or animal disease, comprises a recombinase and two probes, each containing a homology clamp and an anchoring sequence.

Disclosure, Fig 9; 103pp; English.

The present invention relates to a composition comprising a recombinase and two complementary single stranded probes each containing at least one homology clamp corresponding or complementary to a preselected target nucleic acid sequence and at least one anchoring sequence. The present sequence is a heterologous insert sequence used to generate the probes that can be used in the present invention. The composition of the present invention can be used to modulate transcription or replication of a present elected target sequence, treat a disease state of a plant or animal

caused by expression of a disease gene, detect a double stranded nucleic acid target sequence, isolate either strand of a double stranded target sequence, isolate either strand of a member of a gene family, produce a transgenic non-human organism or plant, determine the function of a double stranded nucleic acid target sequence and inhibit double stranded nucleic acid rotation or branch migration. In addition, the composition may be used to produce animal models for genetic defects

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the ISSR-related PCR primer of the invention.

                                                                                                                                                                                                                                                                                 The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (b) a primare designed based on the chromosome marker contrivell plates; (b) a primar designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the miltiwell plates of the specified discrimination Nos. to array the multiwell conficultures are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The mixed suseful for gene analysis. ABM42957 to ABM45321 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

of the invention

The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences. Then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AA29483-514 represent sequences from Haliotis discus, used in the method

comprises isolating a library with high homogeneity by DNA fragmentation

```
This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 6423.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBP-rP2, IGFBP-RP8, HGSZ4 and ecogenin. It is known to stimulate DNA synthesis and promore chemotaxis of fibroblasts, however, it is also upregulated in cute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonuclectides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disocuters (particularly cancer, e.g. breast, prostate or renal cancer), culmonary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiarteriosclerotic activities. This coligonucleotide sequence is a chimeric phosphorothicate antisense oligo with 2 MOE wings and a deoxy gap, which is used to inhibit expression of mouse CTGF of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                           /mod_base= OTHER //notes "OTHER= phosphorothioate backbone, where 1-5 and 16-20 are 2' methoxyethyl nucleotides. All cytidines are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atherosclerosis.

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine Mbol DNA fragments of between 250 and 500
consisted than (AC)15 and a (TC)15 oligomucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
clones cross-hybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100,000. The sequence information
for 2, 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
specification and indexed herein (see below). The sequences upstream and
commercem of the microsatellite sequence were used to generate the
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellity individuals, for parentage resting, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
connect planes. The sequence of the construction o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                          Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            OPTIPRIM; breeding; cattle; parentage; amplification; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DB 1; Length 18; 94;

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 correcting a library of bovine MboI DNA fragments of between 250 and 500 corrections at a (AC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of for ca. 230 such bovine microsatellites is summarised in the sequence information consistent of the microsatellite sequence were used to generate the cequired pCR primers for in vitro amplification of the corresp. microsatellite (using the program OFTPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of preeding. The sequence is that of a bovine microsatellite sequence obtd, by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence upstream and specification and indexed herein (see below). The microsatellites may be required PCR primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTPRRM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of connecting important traits esp. in cattle, to allow selective breeding. Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

Table 7; Page 329; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and

A (CA)9 simple sequence repeat is used to illustrate the novel method for detecting SSR polymorphisms without the need for direct sequencing or gelectrophoresis. The length of a particular repeat region (i.e. number of repeat sequences can be highly polymorphic; the sequences flanking the repeat region, however, are conserved. Detection of a SSR of a specific length is achieved by successful ligation of two oligonucleotides, one being exactly complementary to the repeat region and one of its conserved flanking sequences (i.e. comprising the sequence (GT)9) and the other being complementary to the other conserved flanking sequence. The length of a particular repeat region (i.e. number of repeats) can be highly polymorphic; the sequences flanking the repeat region, however, are conserved. Detection of a SSR of a specific length is achieved by successful ligation of two oligonucleotides, one being exactly complementary to the repeat region and one of its conserved flanking sequences and the other being complementary to the other conserved flanking sequence. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PN field.)

This antisense oligonucleotide is nuclease resistant and can be used in the treatment of animals, including humans, having a bacterial infection. The treatment comprises administration of such nuclease resistant oligonucleotides targeted to a nucleic acid or protein of the bacterium, oligonucleotides targeted to a nucleic acid or protein of the bacterium, and formulated with a carrier. A compound comprising this nuclease content of an articlease and formulated with a carrier. A compound comprising this nuclease and formulated with a carrier. A compound comprising this nuclease of an ethod is used to treat infections by a wide variety of Gram-positive and gram-negative, or acid-fast, bacteria, in human and veterinary medicine. The methods are particularly used in human-and veterinary medicine. Or patients with acquired immunodeficiency syndrome or those receiving chemotherapy or radiation therapy), optionally in combination with, or chemotherapy or radiation therapy), optionally in combination with, or therapeutic use, the oligonucleotides can be used to control bacteria in the construction of the paper of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating bacterial infections in humans or animals with oligo:nucleotide(s) - resistant to nuclease and targetted to bacterial nucleic acid or proteins, also conjugates of these oligo:nucleotide(s) with antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comparising genomic DNA from tunour cells and cells. The method involves the cells from the same individual cells. The method involves the cells from the same individual comparison plants are selected from cytosine and x = 3-7 (ii) a nucleotide sequence (CG)xRY, where R is as in (i) and X is a nucleotide sequence (CG)xRY, where R is as in (i) and X = 3-7 (iv) a nucleotide sequence (CG)xRY, where R is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7 (iv) a nucleotide sequence (CA)xRY, where R is a purine selected from define and guanine and Y is a pyrimidine selected from adenine and guanine and Y is a pyrimidine selected from adenine and guanine and X = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and guanine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where X is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where X is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where X is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where X is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, und its a pyrimidine selected from cytosine, thymine, and uracil and uracil and x = 6-16, und its a pyrimidine selected from cytosine, thymine, and uracil and uracil and x = 6-16, und its a pyrimidine selected from cytosine, thymine, and ura Primer; quantitation; genetic instability; tumour cell; detection; neoplastic transformation; carcinogenesis; DNA/RNA hybrid; ss.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a sequencing reagent (I) comprising: (a) a capture group (CG) that can form a stable complex with a region of a template nucleic acid (II); (b) spacer region (SR); and (c) sequence complementary sequence on (II). Also described are: (I) array comprising a complementary sequence on (II). Also described are: (I) array comprising an arrangement of many (I), immobilized on a solid support; and (2) method of sequencing (II) using a combinatorial array of (I). Arrays of (I) are used for sequencing nucleic acids by a primer extension method, e.g. to scan for mutations (particularly shingle-nucleotide polymorphisms) and for diagnosis of infectious and genetic diseases. Arrays of (I) allow sequencing of templates without any prior knowledge of the wild-type or expected sequence. By separating the capture and of thousands of hybridisation functions, it becomes possible to use smaller primers, simplifying array analysis, reducing costs and allowing thousands of hybridisation reactions to be done simultaneously. Particularly, 4 times fewer primers are required, compared with standard methods, i.e. since primer extension increases the effective as an array of n-mers in usual methods. The method may be applied to single- or double-stranded DNA, AAX76410 to AAX76440 represent sequencing reagent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

```
The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements or incleotides in length. Also included are a nucleic acid primer outtable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DMA enriched for SSRs and inclentifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DMA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of sequence its a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Simple sequence repeat, plant, ds; SSR, ryegrass; fescue; tandem repeat; cereal profiling; grass profiling; seed batch purity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Poeae.

```
The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence crepeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer cultable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and identifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are contained, and selecting for the SSR in the breeding, a preferentially co-linerited, and selecting for the SSR in the breeding, a correct box profiling grass or cereal species varieties by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal seed batches, and for DNA profiling to establish the creal seed batches, and for DNA profiling to establish the selection of secue SSR secue according to establish the sequence is a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                                                                                                                                                   New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Simple sequence repeat, plant, ds, SSR, ryegrass, fescue, tandem repeat, cereal profiling, grass profiling, seed batch purity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1.7%; Score 18; DB 1; Length 18;

```

```
The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements core repeat (SSR) in a nucleic acid primer and length. Also included are a nucleic acid primer centrable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and dentifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing variation within seed batch of an SSR. The SSRs core as beection of genes in grass or cereal breeding, for may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profiling to establish the confidentity, uniformity and/or stability of a cultivar. The present sequence is a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                                                                                                                  New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species varieties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Simple sequence repeat; plant; ds; SSR; ryegrass; fescue; tandem repeat; cereal profiling; grass profiling; seed batch purity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated mucleotide core elements or enclocide or amplifying an SSR, identifying are a nucleic acid primer suitable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and clentifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely a secentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing variation between SSRs varieties and testing the purity of grass or cereal species varieties, for tering the purity of grass or cereal species varieties, for tering the purity of grass or cereal species varieties, for tering the purity of grass or cereal species varieties, for tering the purity of grass or cereal species varieties, for tering the purity of grass or cereal species varieties, for tering the purity of grass or cereal species varieties, for tering the purity of grass or cereal section of genes in grass or cereal section of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic oligonucleotide; dinucleotide repeat; cytostatic; apoptosis; cell cycle arrest; cell proliferation; caspase; cytokine; interleukin; tumour necrosis factor; TNF; cancer; carcinoma; sarcoma; leukemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The present sequence is that of a synthetic oligonuclectide useful to the invention. The invention relates to a composition, comprising a 2 to 20 has a 3-04, 3-04 synthetic oligonucleotide which comprises multiple base 3-04, 3-04 synthetic oligonucleotide which comprises multiple formula and having cytostatic activity. The oligonucleotide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, are useful for inducing cell cycle arrest, inhibition of proliferation, activation of caspases and induction of apoptosis or production of cytokines such as interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumour necrosis factor (INF)-alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary carcinoma, primary sarcoma and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, cvarian or bone cancer. The compositions induce apoptosis independent of Pas, p53/p21, p21/waf-1/CIP p15(ink4B), p16(ink4), drug resistance, caspase 3, transforming growth factor (TGF)-beta 1 receptor Gaps 0 1.7%; Score 18; DB 1; Length 18; 100.0%; Pred. The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tendenly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs may be are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention Primer for detecting polymorphisms among highly related plant species Novel simple sequence repeats in clover species useful for selection genes in legume breeding, for profiling legume species varieties and testing the purity of legume seed batches. ö The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. cycloox - by amplification of mRNA followed A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily Human NADPH quinone oxidoreductase 2 (NQO2) polymorphic sequence #38. Gaps .. 1.7%; Score 17.8; DB 1; Length 21; 90.5%; Pred. Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 16; Page 130; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytcohrome P450 A1 (CPP4501A1), cytcohrome P450 A2 (CPP4501A1), cytcohrome P450 A2 (CPP4501A2), cytcohrome P450 A2 (CPP4501A1), cytcohrome P450 A2 (CPP4501A2), cytcohrome P450 A2 (CPP4501A1), cytcohrome P450 A2 (CPP4501A2), cytcohrome P450 A2 (CPP4501A2), adrenegic receptor beta1 (ADBR1), cytcohrome P450 A2 (CPP4501A2), adrenegic receptor beta1 (ADBR1), cytcohrome P450 A2 (CPP4501A2), and base acid with a control (ARN), cathegein S (CTSS), cyclooxgenae 2 (CPPA2), diazapam binding protein (PLAP), glutathione-S-transferase 2 (CPPA2), histohrome-N-methyl cransferase (MNMT), MADBH quinone-S-transferase 2 (MNQZ), culfortansferase (MNMT), MADBH quinone-S-transferase 2 (MNQZ), culfortansferase (MNMT), MADBH quinone-S-transferase 2 (MNQZ), culfortansferase (MNZ), or copy of transferase (MNZ), or copy of transferase (MNZ), or copy of transferase (MNZ), copy of transferase (MNZ), and the copy of transferase (MNZ), or copy of transferase (MNZ), and the copy of transferase (MNZ), or copy of transferase (MNZ), cythan unclear receptor (MNZ), multidrug resistance 1 (MNZ), or copy of transferase (MNZ), and the copy of transferase (MNZ), cythan and copy of transferase copy of the property in the protein in the protein in the protein in the peripheral nervous system function. The present sequence represents a polymorphic DNA sequence of the invention

(DNAS-) DNA SCI LAB INC.

Guida M, Hall J;

WPI; 2002-698522/75.

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 16; Page 131; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known concurred to the sequence of a variation from that of a known concurred to the sequence page 20 A2 (CTP4501A2), advencency correctione P450 O2E1 (CYP4501A1), advencency correctione P450 O2E1 (CYP4500A2), advencency correctione P450 O2E1 (CYP4500A2), advencency correctioned P450 O2E1 (CYP4500A2), advencency correctioned P450 O2E1 (CYP4500A2), advencency correctioned P450 O2E1 (CYP5), advencency correction (FAB1), approximate a correction (FAB1), epoxyde phydroxylase 2 [EPHX2), 5-lipoxygenase activating inhibitor (DB1), beoxyde phydroxylase 2 [EPHX2), 5-lipoxygenase activating corresponding from the correction (FAB1), NADPH quinone oxidoreductase 2 (NDO2), transferase (NNWT), NADPH quinone oxidoreductase 2 (NDO2), transferase (NOTEN), NADPH quinone oxidoreductase 2 (NDO2), transferase (UGT2B15), uroxinase receptor (URP1), unitiding resistance associated protein 3 (NDP3), lactoriansferase (UGT2B15), uroxinase receptor (URP12), unitiding resistance associated protein 3 (NDP3), lactoriansferase (NDMP1), lactoriansferase (CHWR1), chwR2, CHWR3, CHWR3, CHWR3, CHWR3) chwR4 or CHWR5) sequence. The polymorphisms in the human genes cited in the invention are useful as genetic linkage markers for locating and characterising the genes responsible for a variety of disorder-related comprision or underexpression, which may be used in diagnosing and characterising the disorders. The nucleic acid molecules comprising the polymorphic sequences conteained in CYP4501A1, CYP4501A1, CYP4501A2, CYP4501A2, MWR1 and/or MDR3 are useful for screening individuals for altered central custom conteained in CYP4501A1, CYP4501A1, CYPA501A1, CYPA501A1, CYPA501A1, CYPA501A1, CYPA501A1, CYPA501A1, CYPA501A1, CYPA501A1, CYPA501A2, CAPACA1A1, C

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of for ca, 230 such bovine microsatellites is summarised in the sequence information specification and indexed herein (see below). The sequence information of required PCR primers for in vitro amplification of the ogenerate the microsatellite (using the program OPTIRRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economic trait leads of the catefinism of conomic trait leads in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
nervous system function, in FLAP and HNWT for altered pulmonary, immunological or haematological function, in KLK2 for altered serine protease activity in the prostate, in LTF for altered immunological or haematological function, in CHWR3, CHWR4 or CHWR5 for altered central and peripheral nervous system function. The present sequence represents a polymorphic DNA sequence of the invention

SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Example 17; Col 44; 64pp; English.

The present sequence is one of a number of antisense compounds of up to 30 nucleobases in length that are capable of inhibiting the expression of phosphoenon pyruvate carboxykinase-cytosolic (PEPCK-cytosolic). The antisense compounds are useful for inhibiting the expression of PEPCK-cytosolic in cells or tissues. They are commonly used as research capagnes and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing between functions of various members of a biological pathway and for research use. The dalay infection, inflammation or tumour formation. ```
The invention relates to antisense oligonucleotides targeted to a nucleic acid molecule encoding human Survivin, where the antisense oligonucleotides inhibits the expression of human Survivin. These catisense oligonucleotides are used in the treatment of an animal antisense oligonucleotides are used in the treatment of an animal so suffering from a disease or condition associated with Survivin, e.g. a hyperprofilerative condition such as cancer, and comprises administering a therapeutically or prophylactically effective amount of the animatering at the approciate so that expression of Survivin is inhibited. The collyonucleotides can also be used to treat a human suffering from a disease or condition characterised by a reduction in apoptosis comprising administering the antisense oligonucleotide to a human. In addition, the antisense oligonucleotide modulate apoptosis, cytokinesis or the call cycle, or inhibit the proliferation in a cancer cell by contacting the cile and antisense oligonucleotide. AAS21521-AAS21768 represent Survivin used in the method of the invention

ARNT, EPHX2, GST12, NRWT, NQO2, NR112, STW, UGT2B4, UGT2B15, AJR, MDR1 and/or MDR3 are useful for screening individuals for altered drug metabolism. The polymorphic sequences contained in CYPF301A1, CYPP4501A2, AJR, MDR1 and/or MDR3 may also be used to screen individuals for susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are used to screen for altered cardiovascular function, in COX2 for altered necrous system function, in FLAP and HNMT for altered pulmonary, immunological or haematological function, in KLK2 for altered serine procease activity in the prostate, in LTF for altered immunological can hematological function, in CHMR3, CHMR4 or CHMR5 for altered central hematological function, in CHMR3, CHMR4 or CHMR5 equence represents a polymorphic DNA sequence of the invention

Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

Table 7; Page 396; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleocide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (TG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the septence information specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPPIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of

This invention describes novel oligonucleosides that causes RNaseH-
mediated cleavage of target RNA comprising (a) an RNaseH-activating
region (R1) of at least 3 consecutive 2 unaubstituted nucleosides
connected by charged internucleoside links and (b) a non-RNase activating
region (R2) of at least 2 nucleoside links and (b) a non-RNase activating
selected internucleoside link. The oligonucleosides of the invention have
base sequences complementary to that of target RNA. The products of the
invention are used to inhibit transcription of target RNA in a cell or
corganism, they are antisense molecules that also activate RNAseH.
Particularly the oligonucleosides are used in diagnosis and treatment of
disease associated with endogenous or foreign gene expression. Use
against human papilloma vitus is exemplified. The modified
internucleoside links improve target specificity, potency and binding
affinity (Ra) compared with racemic analogues. They are also more
resistant to nuclease and so have better in-vivo lifetimes. The chirally
selected linkages in R2 allow control of binding affinity. AAXS68SS-
X56881 represent oligonucleosides used in the method of the invention
                                                                                                                                                                                                                                                                         Oligonucleoside; RNaseH-mediated cleavage; target; RNaseH; inhibitor; internucleoside linkage; antisense; diagnosis; treatment; disease; binding affinity; Ka; nuclease resistance; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligo:nucleotide(s) causing cleavage of target RNA - with RNaseH activated segment having charged inter-nucleoside links and second segment with chirally selected links.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1.6%; Score 17; DB 1; Length 17;

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The sequences AAT66084-T66107 repeats sequences of low informativeness found in specific human genes. This repeat sequence is found in the angiogenin gene located at chromosomal position 14q11-q13. The sequence is amplified by primers AAT66100-1. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Phosphonate internucleosidyl linkage; chirality; hybridization; racemic; binding affinity; 88.

The invention provides methods for preparing oligomers having phosphonate internucleosidyl linkages of a preselected chirality which hybridize to a target RNA sequence. The method of making comprises: (a) synthesizing a nucleoside dimer, trimer, or tetramer with racemic internucleosidyl phosphonate linkages; (b) purifying the racemic nucleoside to a chirally pure nucleoside; and (c) sequentially linking at least 2 of the chirally pure nucleosides to form a synthetic oligomer that is enriched for phosphonate internucleosidyl linkages of a preselected chirality and is complementary to an RNA target sequence. The methods are useful for providing chirally enriched synthetic oligomers have enhanced binding affinities for RNA compared to oligomers with racemic all methylphosphonate internucleosidyl linkages. Sequences AAX91054-75 represent oligomers chemically synthesised using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genomic DNA analysis; 5' variation generator; 3' fragment generator; endangered animal identification; PCR primer; 88.

                                                                                                                                                                                    The patent discloses a method and associated kit for analysing genomic DNA in a sample. The method comprises conducting a nucleic acid second oligonucleotide primer to produce DNA fragments based on repeat sequences on at least one end of the genomic DNA. The first and sequences on at least one end of the genomic DNA. The first primer is a solution generator including a repeat sequence and at least one nonsepart nucleotide. The second oligonucleotide primer is a 3' fragment generator starting within such a genetic distance that amplification of the genomic DNA can be performed and preferably includes inosine. The method is useful for the genetic analysis of an individual organism, particularly of species or individual. It is also useful for the rapid and straight forward identification of endangered animals or plants. The present DNA sequence is a 5' variation generator oligonucleotide PCR
                                                    Analyzing genomic DNA in a sample, useful for analyzing genes of organisms (e.g. a species or individual) or identifying endangered animals or plants, by using oligonucleotide primers comprising universal variable fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides, The nucleotides are used as probes or primers for detecting, dentifying quantifying and/or amplifying nucleic acids, as in vitro sense and antisenes sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides [also vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies or viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours and/or prognosis of these diseases. The nucleotides and polypeptides can and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules. expression of the nucleotides. \$

Quantitating genetic instability.

Claim 4; Col 29-30; 27pp; English.

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tumour cells and genomic DNA from normal cells. The method involves the cells from the same individual with oligonuclectide primers selected from (i) a nuclectide sequence (CG) xRG, where R is a purine selected from adenine and guanine and x = 3-7, (ii) a nuclectide sequence (CG) xRY, where R is as in (1) and Y is a

pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iii) a nucleotide sequence (CG)xRR, where R is as in (1) and x = 3-7, (iv) a nucleotide sequence (CG)xYY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (V) a nucleotide sequence (CA)xXY, where R is a purine selected from adenine and guanine and x = 6-6, (V) a nucleotide sequence (CA)xXY, where R is a purine selected from adenine and guanine and Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xXY, where X is a pyrimidine selected from dynosine, thymine, and uracil and x = 6-16, (viii) a nucleotide sequence (CA)xYY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers. The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comparison genomic DNA from tumour cells and genomic DNA from tumour cells. The method involves the cells from the same individual with oligonucleotide primers selected from adenine and x = 3-7 (Ii) a nucleotide sequence (CG)xRY, where R is as in (i) and x = 3-7, (ii) a nucleotide sequence (CG)xRY, where R is as in (i) and x = 3-7, (ii) a nucleotide sequence (CG)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG)xXY, where R is a pyrimidine selected from adenine and guanine and x = 6-16, (vi) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and ynamine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from formine and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination continuous stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                                     Primer; quantitation; genetic instability; tumour cell; detection; neoplastic transformation; carcinogenesis; DNA/RNA hybrid; ss.

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                           Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; melanocortin-1 receptor; MCIR; promoter; regulation; detection;

Also described is a method for detecting a substance affecting synthesis of melanin in which a host transformed by an expression vector, comprising a control active polynucleotide derived from MCIR, is cultured in the presence of a sample to be rested and a signal formed by the expression of said reporter gene is detected. The control-active polynucleotide is used for the detection of a substance affecting synthesis of melanin. The present sequence represents a human melanocortin-1 receptor gene TMTA box oligonucleotide, which is given in the exemplification of the present invention
                                                                                                                The present invention describes a control-active polynucleotide derived from the human melanocortin-1 receptor (MC1R) gene upstream controlling sequence. Also described is a method for detecting a substance affecting synthesis of melanin in which a host transformed by an expression vector, comprising a control active polynucleotide darived from MC1R, is cultured in the presence of a sample to be tested and a signal formed by the expression of said reporter gene is detected. The control-active polynucleotide is used for the detection of a substance affecting synthesis of melanin. The present sequence represents a human melanocortin-1 receptor gene TMTA box oligonucleotide, which is given in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably CMCTAAL). The method involves determining the number of thymidiahe-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene
                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                       Human uridine diphosphate glucuronosyltransferase gene polymorphism #1

                                                                                                                                                                                      The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGTAAL). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that
                                                                 gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                                                                          are glucuronidated by UGT. The present DNA sequence represents a UGT gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; antisense; lung dysfunction, nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.

```
the invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genemic flanking regions, 5' and 3' intron-exon junctions or regions within 2-10 nucleotides of junctions of genee encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entilnflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of biquinone or lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed approach of the printed or form the printed or

```
The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a correlating the repeats. The computational methods (polymorphic repeat. The computational methods (polymorphic repeat. The computational methods (polymorphic repeat in a marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Hautington's disease, fragile-X syndrome, Fredieich's atexais, myctonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocereballar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     o;
                                                                                                                                                                                                                                                                                                                       for
                                                                                                                                                                                                                                                                                                                  Identifying a candidate polymorphic repeat within a coding sequence, funderstanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for polymorphic probability.

A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GRNESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 6423.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBF-FP2, CTGFBF-8, Heast and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic lenkaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, e.g. breast, prostate or renal cancer), pulmonary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As such, the present invention describes these antisense oligos as having cycostatic, dermatological and antiatteriosclerotic activities. This oligonucleotide sequence is a chimeric phosphorothioate antisense oligo with 2, MOE wings and a deoxy gap, which is used to inhibit expression of mouse CTGF of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                   - by amplification of mRNA followed
electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

This sequence represents a PCR primer used to amplify the chemokine macrophage inflammation protein 3 beta (MIP 3beta) coding sequence. The PCR product is used in the analysis of dendritic cell response to different chemokines. The invention relates to the use of chemokines which are capable of directing dendritic cells, in the manufacture of a medicament for the treatment of a disease state. Methods are included for treatment to the disease state. Methods are included for crivation of antigen-presenting dendritic cells. The chemokines can be used to initiate, amplify or modulate an immune response. The chemokines use useful for the treatment of disease states e.g. a bacterial, viral, fungal or parasitic infection, cancer (especially melanomal, breast, pancreatic, colon, lung, glioma, hepatocellular, endometrial, gastric, intestinal, renal, prostate, thyroid, ovarian, testicular, liver, head and neck, colorectal, oseophagus, stomach, eye, bladder, glioblastoma and neck, colorectal, oseophagus, stomach, eye, bladder, glioblastoma and incential and control and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; chemokine; MCP-4; hMCP-4; ss; 6Ckine; dendritic cell; renal; autoimmune disease; tissue rejection; allergy; cancer; hepatocellular; melanoma; breaat; pancreas; colon; glioma; endometrium; intestine; lung; prostate; thyroid; ovary; testis; liver; head; neck; colorectal; bladder; osephagus; stomach; eye; glioblastoma; gastric; metastatic cardinoma; immunosuppressive; antiallargic; cytostatic; rectum; RT-PCR; primer; reverse transcriptase; macrophage inflammatory protein 3 beta;

                                                                                                                                                                                                                                                                                                                                  site of
                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method for enhancing an immune response in a mammal, comprising administering chemokine MCP-4 or 6Ckine or their biologically active fragments. The chemokines are capable of directing the migration of dendritic cells to manufacture a medicament for a disease state. The invention is used to treat disease states, including an autoimmune disease, tissue rejection or an allergy, or a cancer, particularly melanoma, breast, pancreatic, colon, lung, glioma, hepatocellular, endometrial, gastric, intestinal, renal, prostate, thyroid, ovarian, testicular, liver, head and neck, colorectal, thyroid, ovarian, eye or bladder cancer, glioblastoma or metastatic carcinoma. This sequence represents an RT-PCR primer for macrophage inflammatory protein 3 beta (MIP-3 beta), used in analysis of responsiveness to chemokines
                                                                                                                                                                                                                                                                                                                                  Using chemokine MCP-4 or 6Ckine to attract dendritic cells to the situan an antigen is useful to treat disease states, particularly autoimmune disease, tissue rejection, allergy and cancer.

                                                                                                                                                                                                    Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer directed primer, comprising of a perfect capt. Sequence repeat (SSR), and an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for genetic trait marking and germplasm comparisons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes, useful for genotyping diverse genomes of plant and
                                                                                                                           Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inter-simple sequence repeat; ISSR; SSR; PCR; primer; genotyping; plant;
animal; Basmati rice; 88.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MooI DNA fragments of between 250 and 500 concenting a library of bovine MooI DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 concers cross-tybridised. Assuming independent distribution of 50 microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites and mooI sites, the frequency of (T6)n >9 microsatellites of for ca. 230 such bovine microsatellites is summarised in the cyperification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the crossatellite (using the program OPPIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective field.)
(ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the ISSR-related PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

                                                                                                                                                                                                                                                                                                                                              RESULT 210
                                                                                                                                                                                                                                                                                                                                                                AAQ33786
                                                                                                                                                                                                                                                                                                                                                                                   8888888
```

```
A method has been developed for labelling an oligonucleotide having a repeated sequence of (XY)n (where X and Y consists of a combination of adenine and thymine or uracil or guanine and cytosine, and n is an integer of 1 or more ) at the 3'-terminal side in which the repeated sequence is added and extended using a labelled body of the nucleotide constituting the repeated sequence and a DNA polymerase lacked in 5' to 3' exonuclease activity. The method can be used for detecting a gene. The method can detect a gene in a sensitivity up to ten times higher than prior art methods. The present sequence represents a primer used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Primer; oligonucleotide; labelling; detection; self-priming; PCR; ss.

.. 0 A method has been developed for labelling an oligonuclectide having a repeated sequence of (XY)n (where X and Y consists of a combination of adenine and thymine or uracil or guanine and cytosine, and n is an integer of 1 or more) at the 3'-terminal side in which the repeated sequence is added and extended using a labelled body of the nucleotide constituting the repeated sequence and a DNA polymerase lacked in 5' to 3' exonuclease activity. The method can be used for detecting a gene. The method can be used for detecting a gene. The prior art methods. The present sequence represents a primer used in an Gaps Primer; quantitation; genetic instability; tumour cell; detection; neoplastic transformation; carcinogenesis; ss. This invention describes a novel method for quantitating genetic ô Labelling of an oligonuclectide - useful for detecting genes Length 18; 1; Indels Sequence 18 BP; 9 A; 0 C; 0 G; 9 T; 0 U; 0 Other Match 1.6%; Score 16.4; DB 1; Local Similarity 94.4%; Pred. instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tumour cells and genomic DNA from tumour cells and genomic DNA comparison pair comprising genomic DNA from tumour cells and genomic DNA comparison primers selected from (i) a nucleotide sequence (CG)×RG, where R is a mucleotide sequence (CG)×RM, where R is as in (i) and x = 3- CM (ii) a nucleotide sequence (CG)×RN, where R is as in (i) and x = 3-7, (ii) a nucleotide sequence (CG)×RN, where R is a pin (i) and x = 3-7, (ii) a nucleotide sequence (CG)×RN, where R is a purimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG)×RN, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CA)×RN, where R is a purime selected from cytosine, admine and Y is a pyrimidine selected from cytosine, admine and Y is a pyrimidine selected from companies and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)×RN, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (viii) a nucleotide sequence (CA)×RN, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (viii) a nucleotide sequence (CA)×RN, where Y is a pyrimidine selected from cytosine, thymine and uracil and x = 6-16, (viii) a nucleotide sequence (CA)×RN, where Y is a pyrimidine selected from cytosine, thymine and uracil and x = 6-16, (viii) a nucleotide sequence (CA)×RN, where Y is a pyrimidine selected from cytosine, thymine and uracil and x = 6-16, (viii) a nucleotide sequence (CA)×RN, where Y is a pyrimidine selected from cytosine, thymine and uracil and x = 6-16, (viii) a nucleotide sequence (CA)×RN, where Y is a pyrimidine selected from cytosine, thymine and uracil and uracil and x = 6-16, and thymine commonly associated view to various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tumour cells and genomic

Quantitating genetic instability.

Claim 4; Col 31-32; 27pp; English.

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tumour cells and genomic DNA from normal cells. The method involves the cells from the same individual with oligonucleotide primers selected from (i) a nucleotide sequence

CC (CG)xRG, where R is a purine selected from adenine and guanine and x = 37, (ii) a nucleotide sequence (CG)xRY, where R is as in (i) and Y is a
CC anucleotide sequence (CG)xRY, where R is as in (i) and x = 3-7, (iii)

Quantitating genetic instability.

Claim 4; Col 19-20; 27pp; English.

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tumour cells and genomic DNA from normal cells. The method involves the cells from the same individual with oligonucleotide primers selected from (i) a nucleotide sequence (CG)xRG, where R is a purine selected from adenine and guanine and x = 3-7, (ii) a nucleotide sequence (CG)xRY, where R is as in (i) and Y is a

pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iii) a nucleotide sequence (CG)xRR, where R is as in (i) and x = 3-7, (iv) a nucleotide sequence (CG)xYY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and guanine and x = 6-16, (vi) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and guanine and Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRR, where R is a purinine selected from cytosine, is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (viii) a nucleotide sequence (CA)xXR, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers. The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple 9999999999999999989888

Quantitating genetic instability.

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tunour cells and genomic DNA from normal cells. The method involves the cells from the same individual with oligonuclectide primers selected from (i) a nucleotide sequence (CG)xRG, where R is a purine selected from adenine and guanine and x = 3-7, (ii) a nucleotide sequence (CG)xRY, where R is as in (i) and X is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iii) a nucleotide sequence (CG)xRR, where R is as in (i) and X = 3-7, (iii)

nucleotide sequence (CG)xYY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CA)xRG, where R is a purine selected from adenine and guantine and x = 6-16, (vi) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and quantine and Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRX, where R is a purine selected from cytosine, where R is a purine selected from adenine and x = 6-16, (vii) a nucleotide sequence (CA)xYY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (xx) a combination of the primers. The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple %

```

The invention relates to a substantially purified or isolated nucleic acid (1) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2.6 nucleotides in length. Also included are a nucleic acid primer suitable for amplifying an SSR, included are a nucleic acid primer cautable for amplifying an SSR, included for SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the MI, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely a second control of the son and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing variation between SSRs varieties and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, and for DNA profiling to establish the distinct identity, uniformity and/or stability of a cultivar. The present sequence is a ryegrass or fescue SSR

The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR). having 2 or more tandemly respeated nucleotide core elements 2 conclections in length. Also included are a nucleic acid primer suitable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and identifying clones in the library containing SSRs, a library of ryegrass or fescue genomic containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profilling grass or cereal species varieties by assessing each batches by assessing variation between SSR varieties and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for profilling grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or dereal species varieties, for testing the purity of grass or dereal species varieties, for testing the purity of grass or dereal species varieties, for testing the purity of grass or dereal species varieties, for testing the purity of grass or dereal species varieties, for testing the purity of grass or dereal species varieties, for testing the purity of distinct identity, uniformity and/or stability of a cultivar. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 mucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/legume breeding. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel simple sequence repeats in clover species useful for selection genes in legume breeding, for profiling legume species varieties and testing the purity of legume seed batches.

The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as ulcerative collists and Crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention Testing for the presence of polymorphisms associated with inflammatory bowel disease, using a hybridization assay. Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter. The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is useful invention is also useful in optimising drug desages and predicting an individual s ensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism Gaps .. 0 Query Match 1.6%; Score 16.4; DB 1; Length 19; Best Local Similarity 94.4%; Pred. Detecting polymorphisms in uridine diphosphate glucuronosyltransferase

```
This invention describes a novel murine calpain protease 12 (capn12). The calpain procease of the invention, related proceins and nucleic acid that encodes it, are useful for treatment (including gene therapy) of diseases associated with insufficient expression of the calpain protease. The protein is also used to screen for calpain protein effectors and to raise specific immunoglobulins (Ig) useful for diagnosis. Also the polynucleotide encoding capn12 is useful, e.g. as primers and probes, for
                                                                                  The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGTA1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter — as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene
gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Calpain protease; murine; gene therapy; screening; diagnosis; capn12; ss.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (ACJ15 and a (TC)15 oligomordeotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of in the bovine part of estimated at >100, 000. The sequence information of specification and indexed herein (see below). The sequences upstream and commistream of the microsatellite sequence were used to generate the incrosatellite (using the program optification of the corresp. microsatellite (using the program optification of the corresp. microsatellite (using the program optification of the determinism of conomically important traits esp. in cattle, to allow selective of breeding. The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 screening a library of bovine MboI DNA fragments of between 250 and 500 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information of co. ca. 230 such bovine microsatellites is summarised in the sequence information constrained properties in the sequence by the correspond of the microsatellite sequence were used to generate the comparised for in vitro amplification of the correspond crosatellite (using the program of the microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 creening a library of bovine MboI DNA fragments of between 250 and 500 colones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of in the bovine genome is estimated at >100, 000. The sequence information of specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence where used to generate the required PCR primers for in vitro amplification of the corresp. The microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding See also AAQ33501-34437.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                               Detection, recognition, inhibition and alteration of single and double stranded target nucleic acid sequences - by formation of a triple helix structure using 2 oligomers which block translation.
                                                                                                                                                                                                                                                                                                                                      Two sets of methylphosphonate oligonucleosides ("MP oligomers") and complementary ribooligonucleosides ("MA oligomers") contg. alternating purines and pyrimidines were examined for their ability to form triple helix complexes. (Set 1:G2019 and R138; Set 2:G2018 and R139 - see AAQ68235-38). It was shown that MP oligomers contg. alternating purines and pyrimidines are capable of forming triple stranded complexes with complementary RNA oligomers. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Two sets of methylphosphonate oligonucleosides ("MP oligomers") and complementary ribooligonucleosides ("RNA oligomers") contg. alternating purines and pyrimidines were examined for their ability to form triple helix complexes. (Set 1:G2019 and R138; Set 2:G2018 and R139 - see AAAG6235-38). It was shown that MP oligomers contg. alternating purines and pyrimidines are capable of forming triple stranded complexes.with complementary RNA oligomers. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection, recognition, inhibition and alteration of single and double stranded target nucleic acid sequences - by formation of a triple helix structure using 2 oligomers which block translation.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-dA)n.(dg-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The sequences AAT66084-T66107 represent repeat sequences of low informativeness found in specific human genes. This repeat sequence is found in the ADP/ATP translocase gene. The sequence is amplified by primers AAT66091-2. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Satellite sequence; DNA fragmentation; microsatellite DNA; DNA marker;

The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AAX39483-514 represent sequences from Haliotis discus, used in the method
                                                                                                                                                         Isolation of satellite sequences from genomic DNA for use as DNA markers comprises isolating a library with high homogeneity by DNA fragmentation.

Analyzing genomic DNA in a sample, useful for analyzing genes of organisms (e.g. a species or individual) or identifying endangered animals or plants, by using oligonucleotide primers comprising universal variable fragments.

The patent discloses a method and associated kit for analysing genomic DNA in a sample. The method comprises conducting a nucled caid amplification on the genomic DNA in the sample using both first and second oligonucleotide primer to produce DNA fragments based on repeat sequences on at least one end of the genomic DNA. The first primer is a 5' variation generator including a repeat sequence and at least one nonrepeat nucleotide. The second oligonucleotide primer is a 3' fragment generator starting within such a generic distance that amplification of the genomic DNA can be performed and preferably includes incoine. The method is useful for the genetic analysis of an individual organism, particularly of a species or individual. It is also useful for the rapid and straight forward identification of endangered animals or the rapid present DNA sequence is a 5' variation generator oligonucleotide PCR.

Analyzing genomic DNA in a sample, useful for analyzing genes of organisms (e.g. a species or individual) or identifying endangered animals or plants, by using oligonucleotide primers comprising universal variable fragments.

Example 1; Page 6; 23pp; English.

The patent discloses a method and associated kit for analysing genomic DNA in a sample. The method comprises conducting a nucleic acid amplification on the genomic DNA in the sample using both first and second oligonucleotide primer to produce DNA fragments based on repeat sequences on at least one end of the genomic DNA. The first primer is a softwartion generator including a repeat sequence and at least one non-repeat nucleotide. The second oligonucleotide primer is a 3' fragment generator starting within such a genetic distance that amplification of the genomic DNA can be performed and preferably includes inosine. The method is useful for the genetic analysis of an individual organism, particularly of a species or individual. It is also useful for the rapid and straight forward identification of endangered animals or plants. The present DNA sequence is a 5' variation generator oligonucleotide PCR

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating comparison galar comparison genomic DNA from tumour cells and genomic DNA from tumour cells and genomic DNA from tumour cells and genomic DNA from tumour cells. The method involves the cells from the same individual with oligonucleotide primers selected from debanine and x = 3-7 (ii) a nucleotide sequence (CG)xRY, where R is as in (i) and Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iii) a nucleotide sequence (CG)xRY, where R is as in (i) and x = 3-7, (iii) a nucleotide sequence (CG)xXY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG)xRY, where R is a pyrimidine selected from cytosine, thymine and y is a pyrimidine selected from adenine and guanine and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a pyrimidine selected from adenine and guanine and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and uracil and x = 6-16, and uracil and x = 6-16, and its a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and its a pyrimidine selected from cytosine, thymine, and uracil and is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating comparison genomic DNA from tumour cells and genomic DNA candinal cells. The method involves the cells from the same individual colls. The method involves the cells from the same individual colls. The method involves the cells from the same individual colls. The object of sequence (CG)xRV, where R is as in (i) and x = 3-7, (ii) a nucleotide sequence (CG)xRY, where R is as in (i) and x = 3-7, (iii) a nucleotide sequence (CG)xXY, where R is a sin (i) and x = 3-7, (iv) a nucleotide sequence (CG)xXY, where R is a pyrimine selected from adenine and guanine and vacil, and x = 5-16, (vii) a nucleotide sequence (CA)xRY, where R is a purine selected from cytosine, (vii) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and guanine and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and Quanine and x = 6-16, (viii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and Quanine and x = 6-16, which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Primer; quantitation; genetic instability; tumour cell; detection; neoplastic transformation; carcinogenesis; DNA/RNA hybrid; ss.

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison genomic DNA from tumour cells and genomic DNA (13) a nucleotide sequence (CG) XRY, where R is as in (i) and x = 3-7, (ii) a nucleotide sequence (CG) XRY, where R is as in (i) and x = 3-7, (iii) a nucleotide sequence (CG) XRY, where R is as in (i) and x = 3-7, (iii) a nucleotide sequence (CG) XRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iv) a nucleotide sequence (CG) XRY, where R is a pyrimidine selected from cytosine, thymine and guanine and Y is a pyrimidine selected from cytosine, (vi) a nucleotide sequence (CA) XRY, where R is a purine selected from cytosine, (vii) a nucleotide sequence (CA) XRY, where R is a purine selected from denine and guanine and x = 6-16, (vii) a nucleotide sequence (CA) XRY, where R is a pyrimidine selected from cytosine, (viii) a nucleotide sequence (CA) XRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers. The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel method for quantitating genetic instablity independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tumour cells and genomic DNA from normal cells and genomic DNA from normal cells. The method involves the cells from the same individual
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Primer; quantitation; genetic instability; tumour cell; detection; neoplastic transformation; carcinogenesis; ss.

with oligonucleotide primers selected from (i) a nucleotide sequence (CG) xRG, where R is a purine selected from adenine and guanine and x = 3-7, (ii) a nucleotide sequence (CG) xRY, where R is as in (i) and Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iii) a nucleotide sequence (CG) xRX, where R is as in (i) and x = 3-7, (iv) a nucleotide sequence (CG) xRY, where R is a pin did selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG) xRY, where R is a purine and guanine and contine and guanine and cytosine, where R is a purine selected from adenine and guanine and x = 6-16, (vii) a nucleotide sequence (CA) xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers. The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple \$

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid ubiquinone

Disclosure; SEQ ID NO 4755; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions,

junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunctions, or regions within 2-10 nucleotides of nasal airway dysfunction and a second active agent comprising an antinflammatory steroid and ubiquinone. A composition of the invention has antinflammatory steroid and ubiquinone. A composition of the invention antinflammatory antialergic, antiasthmatic, hypotensive.

In antinflammatory and cytostatic activity. The composition may have a use in antiaense gene therapy. The composition is useful for treating preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung aurfactant in a subject s tissue, or treating bronchconneriction, lung allergies, or a respiratory disease or condition. Note: The sequence date for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNNs by using an aggregate of mRNAs and a plural type of abelied reverse transcription primers (GENESED files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of CDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 screening a library of bovine Mbol DNA fragments of between 250 and 500 clones that an (RC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information construction and indexed herein (see below). The sequence information constructed pcz primers for in vitro amplification of the corresp. microsatellite (using the program OPTTRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait lost, or genes involved the determinism of economic trait craits esp. in cattle, to allow selective breeding. germplasm comparisons

Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer directed primer, comprising of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a SSR primer, which is segment. The gramming degenerate nucleotides. The method represents a modified amplified fragment length polymorphism assay, which is particuseful for general fingerprinting, i.e. for genetic trait marking and

Modified amplified fragment length polymorphism assay – for detection of polymorphism esp. in micro:satellite regions.

capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method comparises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of a least part of the SBDs in such systems. Nucleic acid molecules with endomuclease activity and catalylic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, eg. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and ascites and infection, they may also be used to detect genetic drift and catally and condition ascociated with the level of c-raf. Introduction genetized to generally any condition associated with the level of c-raf. Introduction of such systems and activity. AAV90922 to AAV93877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 17 BP; 3 A; 0 C; 1 G; 0 T; 13 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           used as antiviral agents and synthons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 177; Page 154; 259pp; English

This antisense oligonucleotide is nuclease resistant and can be used in the treatment of animals, including humans, having a bacterial infection. The treatment comprises administration of such nuclease resistant oligonucleotides, targeted to a nucleic acid or protein of the bacterium, and formulated with a carrier. A compound comprising this nuclease central targets or resistant oligonucleotide can be covalently linked to an antibitotic. The method is used to treat infections by a wide variety of Gram-positive and Gram-negative, or acid-fast, bacteria, in human and veterinary medicine. The methods are particularly used in immuno-compromised individuals (e.g. patients with acquired immunodeficiency syndrome or those receiving chemotherapy or radiation therapy), optionally in combination with, or fused to, antiviral or other antimicrobial oligonucleotides. Apart from therapt codes, beverages and indistrial processes. The oligonucleotides are specific for bacteria, without affecting metabolism of numanian cells. They may also activate Rhase H and have a general, one specific immune-stimulating effect. The oligonucleotides can be administered orally, intranasally, rectally, topically or by injection, or parameter or polyamine) that
                                                                                                                                                                                                                                                                                                                                                                                   Treating bacterial infections in humans or animals with oligo:nucleotide(s) - resistant to nuclease and targetted to bacterial nucleic acid or proteins, also conjugates of these oligo:nucleotide(s) with antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

This antisense oligonucleotide is nuclease resistant and can be used in the treatment of animals, including humans, having a bacterial infection. The treatment comprises administration of such nuclease resistant of coligonucleotides, targeted to a nucleic acid or protein of the bacterium, and formulated with a carrier. A compound comprising this nuclease resistant oligonucleotide can be covalently linked to an antibiotic. The method is used to treat infections by a wide variety of Gram-positive and Gram-negative, or acid-fast, bacteria, in human and veterinary medicine. The methods are particularly used in immuno-compromised individuals (e.g. patients with acquired immunodeficiency syndrome or those receiving chemotherapy or radiation therapy), optionally in combination with, or fused to, antiviral or other antimicrobial oligonucleotides. Apart from therapy or oligonucleotides can be used to control bacteria in laboratory cultures, foods, beverages and industrial processes. The oligonucleotides are specific for bacteria, without affecting metabolism on mammanian cells. They may also activate Rhase H and have a general, one specific immune stimulating effect. The oligonucleotides can be administered orally, intranasally, rectally, topically or by injection, enhances celling a magent (e.g. carbohydrate or polyamine) that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; lesch.Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumancid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                           Treating bacterial infections in humans or animals with oligo:nucleotide(s) - resistant to nuclease and targetted to bacterial nucleic acid or proteins, also conjugates of these oligo:nucleotide(s) with antiblotics.

Sequences AAH17205 - AAH40944 represent PCR primers, single nucleotide continues of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the includes kits for determining the presence or absence of a SNP, using the cligonucleotides of the invention. The PCR primers are used to amplify a coligonucleotides of the invention. The PCR primers are used to amplify a coligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The cligonucleotides are useful for determining the presence, absence or cligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial cates and infection and cute intermittent porphyria. Phenotypic cinflammation, cancer, nervous system diseases and infection and microorganism. The method is also useful in forensic investigations and microorganism. The method is also useful in forensic investigations and containing DNA sequence

The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal call carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, pression cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, colon and rectum cancer, larynx cancer, leukaemia, liver cancer, lung cancer, kidney cancer, larynx cancer, pancreatic cancer, lung cancer, rad cavityr cancer, ovarian cancer, stomach cancer, testicular cancer, rad cavityr cancer, ovarian cancer, stomach cancer, testicular cancer, and uterine cancer. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to methods for treating or preventing cancer involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce axpression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder ancer, bore cancer, baren and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, leukacimia, liver cancer, lung cancer, Hodgkin's lymphoma, non-Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian cancer, pancreatic cancer, prostate cancer, rhaddomyosarcoma, skin cancer, esticular cancer, inhaddomyosarcoma, skin present sequence is an immunostimular cancer, and uterine cancer. The exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                          Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

```
Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer observable of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a SSR primer, which is a flanked ant its 5°-end by degenerate nucleotides. The method represents a modified amplified fragment length polymorphism assay, which is particuuseful for genome fingerprinting, i.e. for genetic trait marking and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides the protein and coding sequences of human zinc finger protein 14. The sequences can be used in the treatment of cancer, haemopathy, HIV infection, immunological diseases and inflammation. The present sequence is a probe for the coding sequence of
                                                                             Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human zinc finger protein 14 for diagnosing and treating malignant neoplasm, hemopathy, human immunodeficiency virus infection, immunological diseases and various inflammations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, zinc finger protein 14; cancer; haemopathy, HIV infection; immunological disease; inflammation; gene therapy; probe; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                             ch 1.4%; Score 15.2; DB 1; Length 18; 1. The sequence is that of a bovine microsatellite sequence obtd. by

screening a library of bovine Mbol DNA fragments of between 250 and 500

by with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 50

clones cross-hybridised. Assuming independent distribution of

microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites

in the bovine genome is estimated at >100,000. The sequence information

for a. 230 such bovine microsatellites is summarised in the

specification and indexed herein (see below). The sequences upstream and

specification and indexed herein (see below). The sequences upstream and

commerces of the microsatellite sequence were used to generate the

required PCR primers for in vitro amplification of the corresp.

crequired PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellity individuals, for parentage testing, and in the genetic

mapping of economic trait loci, or genes involved the determinism of

economically important traits esp. in cattle, to allow selective

breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

(first entry)

; 0 differentially expresent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnoshing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comparises comparing the level of at least one transcript in a first sample of a tissue to a being neoplastic and the second sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and Gaps Length 15; Sequence 15 BP; 2 A; 4 C; 2 G; 7 T; 0 U; 0 Other; treatment of cancer Query Match

US6333152-B1

The present sequence is that of a synthetic oligonucleotide useful to the invention. The invention relates to a composition, comprising a 2 to 20 invention. The invention relates to a composition, comprises multiple base 3'-OH, 5'-OH synthetic oligonucleotide which comprises multiple crepeats of dinucleotides such as GTT, TG, etc., according to specific formula and having cytostatic activity. The oligonucleotide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, are useful for inducing cell cycle arrest, inhibition of proliferation, activation of caspases and induction of apoptosis or production of cytokines such as interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumnour necrosis factor (INF)-alpha by immune system cells, in an animal having and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, ovarian or bone cancer. The compositions induce apoptosis induce apoptosis is induce apoptosis.

The invention relates to detecting (M1) polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter by determining the presence of five thymidine-adenine (TA) respeats in the promoter, where the presence of the gene. The method is used for detecting polymorphisms in a UGT gene promoter, preferably a UGT I (UGTIA1) gene promoter. (M1) is useful for screening individuals for variation in glucuronidation at UGT gene promoter. (M1) is a UGT gene promoter or TAS-103) are glucuronidated by UGT (Preferably UGT (e.g. Irinotecan or TAS-103) are glucuronidated by UGT (Preferably UGT (e.g. Irinotecan or TAS-103) are glucuronidated by UGT (Preferably UGT (e.g. Irinotecan or TAS-103) are glucuronidated by UGT (Preferably UGT (e.g. Irinotecan or TAS-103) are glucuronidated by UGT (Preferably UGT (e.g. Irinotecan or TAS-103) are glucuronidated by UGT (Preferably UGT (INT)) and the activity of the drug is effected by its level of glucurodination. The method operation of a UGT gene promoter. Thus the DNA and determining the number of TA repeats of in the promoter. The DNA is amplified by a polymerase chain reaction and undividual promoter. The DNA is amplified by a polymerase chain reaction and the number of TA repeats is determined by gel electrophoreals or by a CGT (TA) 5, (TA) 5, (TA) 5, (TA) 5, (TA) 5, (TA) 8, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention relates to detecting (M1) polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter by determining the presence of five thymidine-adenine (TA) respeats in the promoter, where the presence of the five TA repeats correlates with increased expression of the gene. The method is used for detecting polymorphisms in a UGT gene promoter. The method is used for detecting polymorphisms in useful for screening individuals for variation in glucuronidate. (M1) is useful for screening individuals for variation in glucuronidate (TA) and the activity for optimising drug desages for a patient, where the drugs activity, for optimising drug desages for a patient, where the drugs activity (UGTIA) and the activity of the drug is effected by its level of glucurodination. The method preferably involves obtaining DNA from an individual, amplifying all or part of a UGT gene promoter. Thus the DNA and determining the number of TA repeats in the DNA and determining the number of TA repeats of details or by consisting of five TA repeats is determined by gel electrophoresis or by sequencing the amplified DNA. The polymorphism comprises an allele consisting of five TA repeats (TA)5, (TA)6, (TA)5, (TA)6, (TA)5, (TA)7, (TA)5, (TA)8, (TA)6, (TA)6, (TA)7, (TA)6, (TA)6, (TA)6, (TA)7, (TA)6, (TA)6, (TA)6, (TA)7, (TA)6, (TA)6, (TA)6, (TA)7, (TA)6, (TA)6, (TA)6, (TA)6, (TA)6, (TA)7, (TA)6, (TA)6, (TA)6, (TA)7, (TA)6, (T
                                                       Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, comprises determining the presence of five thymidine-adenine repeats in

Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing druq desages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                        The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is useful invention is also useful in optimising drug dosages and predicting an intelvidual s semislivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 16 BP; 8 A; 0 C; 0 G; 8 T; 0 U; 0 Other;

Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.

Claim 7; Page 9; 13pp; English.

The invention comprises a method for detecting polymorphisms in a uridine

```
diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGTIA1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug desages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism

Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, comprises determining the presence of five thymidine-adenine repeats in the promoter.

Example 6; Col 11; 13pp; English.

The invention relates to detecting (M1) polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter by determining the presence of five thymidine adenine (TA) repeats in the promoter, where the presence of the five TA repeats correlates with increased a UGT gene promoter, preferably a UGT IG (UGTA1) gene promoter. (M1) is useful for screening individuals for variation in glucuronidation activity, for optimising drug desages for a patient, where the drugs (e.g. Irinotecan or TAS-103) are glucuronidated by UGT (preferably UGTIA1) and the activity of the drug is effected by UGT (preferably UGTIA1) and the activity of the drug is effected by its level of glucurodination. The method preferably involves obtaining DNA from an individual, amplifying all or part of a UGT gene promoter (UGTIA1) gene promoter (UGTIA1) gene promoter. Thus the DNA and determining the number of TA repeats in the promoter. Thus the DNA being amplified comprises all or part of

```
the number of TA repeats is determined by gel electrophoresis or by dequencing the amplified DNA. The polymorphism comprises an allele consisting of fave TA repeats (TA) is any one of the genotypes (TA) is any one of the determining the number of TA repeats or genetation of the operation of the UT gene, and the individuals sensitivity to the order of the UT gene, and the individuals sensitivity to the order of the UT genetation of the UT genetation of the presence of five, six or seven TA repeats in the promoter. Defects in glucurodination is associated with dibbert's syndrome (TA) repeat region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

```
cc activity, for optimising drug dosages for a patient, where the drugs (e.g. Irinotecan or TAS-103) are glucuronidated by UGT (preferably CC UGTLAI) and the activity of the drug is effected by its level of glucurodination. The method preferably involves obtaining DNA from an individual, amplifying all or part of a UGT gene promoter (UGTLAI gene promoter) contained in the DNA and determining the number of TA repeats in the promoter. Thus the DNA being amplified comprises all or part of UGTLAI promoter. The DNA is amplified by a polymerase chain reaction and the promoter. The DNA is amplified by a polymerase chain reaction and consisting of five TA repeats is determined by gel electrophoresis or by sequencing the amplified DNA. The polymorphism comprises an allele consisting of five TA repeats (TA) 5, six TA repeats (TA) 5, (TA) 5, (TA) 5, (TA) 8, (TA) 6, (TA) 8, (TA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 17 BP; 9 A; 0 C; 0 G; 8 T; 0 U; 0 Other;

The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the individual's sensitivity to exemble the drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism
UGTIA1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule are useful, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV acitivity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, also useful for treating breast, ovarian, colorectal, lung, prostate, shown in NEZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ65220 - ABZ652246, ABZ65230 - ABZ65520 - ABZ65224, ABZ65331, ABZ65230 - ABZ65224, ABZ65331, ABZ65230 - ABZ6524, ABZ65331, ABZ65331, ABZ65324, ABZ6534, ABZ65331, ABZ6534, ABZ6534, ABZ65331, ABZ65331, ABZ6534, ABZ6534, ABZ65331, ABZ65331, ABZ6534, ABZ6534, ABZ65331, ABZ65331, ABZ65331, ABZ65331, ABZ65331, ABZ65331, ABZ65331, ABZ65331, ABZ65334, ABZ65331, ABZ65331, ABZ65331, ABZ65331, ABZ65331, ABZ65331, ABZ65331, ABZ65334, ABZ65331, ABZ65
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prode. to detect differences. The primers used in the amplification comprise a primer directed primer, compressing a sequence repeat (SSN) and an adaptor segment. The present sequence complementary to an adaptor segment. The present sequence is an example of a SSR primer, which is modified amplified fragment nucleotides. The method represents a modified amplified fragment in polymorphism assay, which is particuseful for genome fingerprinting, i.e. for genetic trait marking and

```
Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor segment. The present sequence is an example of a SSR primer, which is flanked at its 5'-end by degenerate nucleotides. The microsense modified implified framer modified amplified framer in the presents a modified amplified framer polymorphism assay, which is particuseful for genome fingerprinting, i.e. for genetic trait marking and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Haematopoietic cell proliferation disorder related oligonucleotide #1242.
                                                                                                                                                                                           Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, haematopoietic cell proliferation disorder; cytostatic; gene therapy; lymphocytic leukaemia; acute myelogenous leukaemia; cytosine methylation state; probe; primer; ss.

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. AEZ03861 to ABZ1118 crepresent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells, for differentiating between acute of invention. Oligonucleotides from the present invention acute of secretaring the cytosine methylation state and/or single nucleotide determining the cytosine methylation state and/or single nucleotide cell proliferation disorder related sequences and their complements; and as primers for the sequences and their complements; and as primers for the cytosine methylation state and/or minion can also be used for detecting a predisposition to, differentiation between the subclasses, diagnosis, prognosis, treatment and/or minioring of haematopoietic cell proliferation of haematopoietic cell proliferative disorders changed the subclasses diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders. The present method enables chighly specific classification of haematopoietic cell proliferative disorders. The present method enables con disorders allowing for improved and informed treatment of patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pelet C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Haematopoietic cell proliferation disorder related oligonucleotide #650.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distingishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ09861 to ABZ1118 crepresent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative clicanter haematopoietic cells; for differentiating between acute disorder haematopoietic cells; for differentiating between acute contact and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide coll proliferation disorder related sequences and their complements; and as primers for the amplification of haematopoietic cell proliferation disorder related sequences from the present invention can also be used for detecting a predisposition to, differentiation between contacting and acute method enables a highly specific classification of haematopoietic cell proliferative chighly specific classification of haematopoietic cell proliferative chigh patients
                                                                                                Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                             Claim 15; Page 47; 117pp; English

```
This invention relates to a novel method for detecting and differentiating between lung cell proliferative disorders associated with refers to one gene and/or their regulatory regions. Specifically, it refers to a method comprising contacting a target nucleic acid in a biological sample with at least one reagent, wherein the reagent is able present in the target DNA. As such, it is possible to further differentiate and diagnose medical conditions including adenocarcinoma differentiate and diagnose medical conditions including adenocarcinoma differentiate und diagnose sytostatic oligomers and squamous cell carcinoma, and their respective adjacent lung tissue. The present invention describes cytostatic oligomers and pNA-oligomers that are useful as probes for determining the cytosine methylation state or single nucleotide polymorphisms (SNPe) of the target sequence. This oligomucleotide sequence is a primer oligomer used for the analysis of the contaction within genomic DNA, used in an exemplification of the
